WHAT WE'RE TARGETING

One topic is pulling the score down — everything else is already strong

Algebra

8/14 (57%)

Coordinates

1/2 (50%)

Probability

1/2 (50%)

Coordinates and Probability are single-question misses (1 mark each on a small sample) — worth a light touch, not a deep intervention. Algebra lost 6 marks, more than any other topic, and the report tags most of it **careless error, not a concept gap** (simplifying, substitution, inequalities, factorising, rearranging formulae) — this is a checking-and-practice problem, not a comprehension one.

WEEK BY WEEK

1 Algebra Foundations + Checking Habit

WEEK 1

- Notes: Algebra (</notes/maths/algebra>)
- Covers her exact misses: simplifying expressions (collecting like terms), substitution with negative values, solving inequalities

Short worksheet on these three skills first (Admin → Homework Generator, topic: Algebra). Build in a **checking habit** from day one: after every answer, she re-substitutes her answer back into the original question to confirm it works, rather than moving straight to the next question. If she's getting them right without hesitating, she does a mixed algebra mock section this week. If she's still pausing or guessing, a second worksheet with fresh questions instead, and the mock waits until week 2.

2 Algebra: Factorising, Rearranging, Forming Equations WEEK 2

- Notes: Algebra (/notes/maths/algebra) — factorising and rearranging formulae subtopics specifically
- Her other three misses this paper: factorising a common factor, rearranging a formula to make x the subject, forming an equation from a worded problem

Same check-first approach: worksheet, then mock only once she's applying the checking habit from week 1 automatically, not just when reminded. By the end of this week the goal isn't just correct answers — it's consistently checking her own work before calling a question finished.

3 Coordinates & Probability Quick-Hit Review WEEK 3

- Notes: Geometry (/notes/maths/geometry) for coordinate translation; Averages & Statistics (/notes/maths/averages-statistics) for probability of combined events
- This is a light-touch week, not remedial — only one question was missed in each area

15 minutes on translating a point by a vector (her exact miss), 15 minutes on combined-event probability (e.g. two dice, two independent draws). Goal is making these automatic, not teaching new concepts. Rest of this session: light revision of Decimals and Number Theory (dividing decimals, lowest common multiple) — not weak overall, but both had a single slip worth tidying up.

4 Full Paper WEEK 4

- One full mock across all topics, not just the three weak ones

Arithmetic, Ratio, Geometry, Percentages, Averages and Data Handling are all already 71-100% — this week checks the algebra/checking-habit fixes hold under full-paper conditions, not that anything new needs teaching there. **If Algebra is above 75% here, we move on to whatever the paper reveals as the next weak spot. If it's still below that, one more focused week on it before moving forward.**

EVERY WEEK, ALONGSIDE THE ABOVE

The checking habit is the real target here, more than any single topic. Nearly all of her lost algebra marks were tagged careless error, not concept gap — meaning she already knows how to do this, she just isn't confirming her own answers before moving on. Building that habit now will help every topic, not just algebra.

Arithmetic, Ratio, Averages, Data Handling and Percentages are already strong (83-100%). No remedial work needed here — just enough light practice each week to keep them sharp while the focus stays on Algebra.
